

ABSTRACT OF THE DISCLOSURE

A software implementable approach capable of creating, delivering, reassembling, rendering, and storing asynchronous and synchronous multimedia message. This approach integrates video/audio streaming with existing Internet/Intranet e-mail messaging and video/audio conferencing systems. The software provides both one-way asynchronous communication as well as bi-directional synchronous communication. Each stream represents a user access from client on one computer to server on the other computer. The method enables electronic multimedia messaging on video/audio capture-equipped mobile platform with limited pre-installed software capability or memory footprint.
